

# Sistema POR

$$G(s) = \frac{Y(s)}{U(s)} = \frac{K e^{-\theta' s}}{\tau s + 1}$$

## 1. Identificación de la función de transferencia :

$$G(s) = \frac{19.42 e^{-1.167s}}{55.96 s + 1} \quad // \quad \frac{19.42 e^{-0.000119s}}{0.056 s + 1}$$

## 2. Transformada z modificada: $G_p(z) = z^{-N} \mathfrak{Z}_m\{G(s)\}$

$$G(z) = \frac{19.42 e^{-0.000119s}}{0.056 s + 1} = \frac{19.42}{0.056} \cdot z^{-1} \cdot \mathcal{P}\left\{ \frac{1}{s + \frac{1}{0.056}} \right\}$$

## Hallamos valores N, $\theta$ , m:

$$\begin{aligned} \bullet N = \frac{\theta'}{T} &= 1 & \bullet m = 1 - \frac{\theta}{T} &= 0.83 \\ \bullet \theta &= \theta' - NT = 1.17 \end{aligned}$$

## Reemplazamos en G(z)

$$G(z) = \frac{19.42 e^{-(\frac{1}{0.056})(0.83)(0.001)}}{0.056 z - 0.056 e^{-(\frac{1}{0.056})(0.001)}} \cdot z^{-1}$$

$$G(z) = \frac{19.1325 z^{-1}}{0.056 z - 0.055}$$

## Aplicamos tabla de z modificada

$$\mathcal{P}\left\{ \frac{1}{s + \frac{1}{0.056}} \right\} = \frac{e^{-amT}}{z - e^{-aT}}$$

## 3. FTP con retenedor ZOH con retardo: $HG(z) = (1 - z^{-1}) z^{-N} \mathfrak{Z}_m\left\{ \frac{G_p(s)}{s} \right\}$ Si el sistema presenta retardo.

$$HG(z) = (1 - z^{-1}) z^{-1} \mathfrak{Z} \frac{19.42 e^{-0.000119s}}{s \cdot (0.056 s + 1)}$$
